

COMPSCI 4CR3

Assignment 2 - Dev Mody

Student Number 400445340

Date : Saturday October 12th 2024

Macid : modyd1

Question 1 :

1. An encryption function $e(k, x)$, where k is the key and x is the message, is said to be linear if $e(k, x+y) = e(k, x) + e(k, y)$ for all keys k and all messages x, y .

(a) (15 points) Explain why a secure encryption function must not be linear; provide an example scenario where Trudy could dangerously exploit this linearity.

(b) (15 points) Recall that the S-box in AES is a function

$$f: \{0, 1, \dots, 255\} \rightarrow \{0, 1, \dots, 255\}$$

The actual S-box is given by the following table.

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
0	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E	0F
1	CA	82	C9	7D	FA	59	47	F0	AD	D4	A2	AF	9C	84	72	CO
2	B7	FD	26	36	3F	7F	CC	34	A5	E9	F1	73	DB	31	72	5C
3	44	8B	4E	00	01	02	03	04	05	06	07	08	09	0A	0B	0C
4	9	83	2C	1A	1B	6E	5A	0A	S2	3D	B6	B3	29	E3	3F	84
5	53	D1	9	ED	20	FC	B1	5B	6A	CB	BE	30	4A	5C	CF	29
6	20	9A	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D
7	51	A3	40	8F	92	9D	38	5F	BC	B6	DA	21	10	FF	F2	02
8	CD	00	13	EC	5F	97	44	17	C4	A7	7E	3D	64	SD	19	73
9	90	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E
A	E9	32	8A	0A	49	6	24	5C	C2	D3	6C	62	91	96	74	79
B	E7	C7	37	0D	SD	15	45	A9	62	56	EA	65	7A	AB	8	8
C	0B	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D	0E
D	70	3E	B5	66	48	3	F6	0E	61	35	57	B9	86	C1	1D	9E
E	E1	FB	98	11	69	19	84	98	9B	1E	87	ED	CE	55	28	DF
F	9C	AC	00	01	02	03	04	05	06	07	08	09	0A	0B	0C	0D

For an input (u, v) in base 16, the output is located in row u and column v . For example, $f(1B, 2)$. Show that this S-box is not a linear function.

b) **Proof By Contradiction:** Assume that the AES S-box is linear. Then we want to show that the property $f(x \oplus y) = f(x) \oplus f(y)$ for

$f: \mathbb{Z}_{256} \rightarrow \mathbb{Z}_{256}$ and any inputs $x = ab$ and $y = cd$ where $a, b, c, d \in \{0, 1, 2, \dots, 9, a, b, \dots, F\}$. The reason we choose to use the

property $f(x \oplus y) = f(x) \oplus f(y)$ is because as we are adding in Extension Fields for AES, we use Definition 4.3.3 where $A(x) + B(x) = \sum_{i=0}^{m-1} C_i x^i$ where $C_i \equiv a_i + b_i \pmod{2} \equiv a_i \cdot x \oplus b_i$ for any $A(x), B(x) \in GF(2^m)$ to show we must show $f(x \oplus y) = f(x) \oplus f(y)$.

Let's say $x = 2E$ and $y = 5A$. This means the output of $f(x)$ is in row 1 and column E of the S-box $[f(x) = 72]$ and similarly for $f(y)$, $f(y) = BE$.

To determine $x \oplus y$ and $f(x) + f(y)$, we can convert both operands into binary values and perform binary addition and convert back to hex.

$$\begin{aligned} x \oplus y &= (1E)_{hex} \oplus (5A)_{hex} \\ &= (00011110)_2 \oplus (01011010)_2 \\ &= (01000100)_2 \\ &= (44)_{hex} \end{aligned}$$

$$\begin{aligned} f(x) \oplus f(y) &= (72)_{hex} \oplus (BE)_{hex} \\ &= (01110010)_2 \oplus (10111110)_2 \\ &= (11000100)_2 \\ &= (CC)_{hex} \end{aligned}$$

$$f(x \oplus y) = (1B)_{hex} \quad \xrightarrow{\text{red}} \quad (1B)_{hex} \neq (CC)_{hex}$$

As a result, since $f(x) \oplus f(y) \neq f(x \oplus y)$

we can say that we have reached a contradiction as the property of linearity does not hold for

$$f: \mathbb{Z}_{256} \rightarrow \mathbb{Z}_{256}$$

Question 2 :

2. (45 points) Suppose we replace the functions in SHA-256 with following functions.

$\text{Ch}(x, y, z) = (x \wedge y) \oplus (x \wedge z) \oplus (y \wedge z)$
 $\text{Ma}(x, y, z) = (x \wedge y) \oplus (x \wedge z) \oplus (y \wedge z)$
 $\Sigma_0(x) = (x \gg R_0) \oplus (x \gg R_1) \oplus (x \gg R_2) \oplus (x \gg R_3)$
 $\Sigma_1(x) = (x \gg R_0) \oplus (x \gg R_1) \oplus (x \gg R_2) \oplus (x \gg R_3)$
 $\sigma_0(x) = (x \gg R_0) \oplus (x \gg R_1) \oplus (x \gg R_2) \oplus (x \gg R_3)$
 $\sigma_1(x) = (x \gg R_0) \oplus (x \gg R_1) \oplus (x \gg R_2) \oplus (x \gg R_3)$

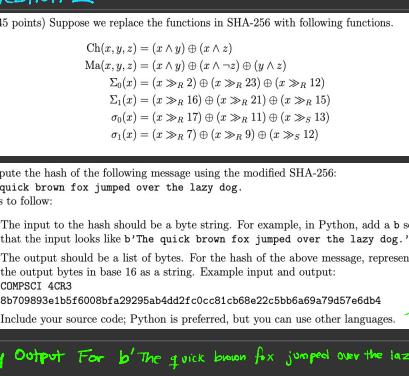

Compute the hash of the following message using the modified SHA-256:
The quick brown fox jumped over the lazy dog.

Rules to follow:

- The input to the hash should be a byte string. For example, in Python, add a `b` so that the input looks like `b'The quick brown fox jumped over the lazy dog.'`
- The output should be a list of bytes. For the hash of the above message, represent the output bytes in base 16 as a string. Example input and output:
COMPSCI 4CR3
8b709893e1b5f6008fb2935ab4dd2fc0cc81cb68e22c5b6b6a69a79d57e6db4
- Include your source code; Python is preferred, but you can use other languages.

My Output For b'The quick brown fox jumped over the lazy dog':

a9098876702b8d3cd741ff69eb534c6ed957da079e0932e43791edb7746b

```

Question 3:

3. (25 points) Let $h_1 : \{0,1\}^* \rightarrow \{0,1\}^n$ and $h_2 : \{0,1\}^* \rightarrow \{0,1\}^n$ be hash functions with output lengths of n bits. Construct a hash function $h : \{0,1\}^* \rightarrow \{0,1\}^{2n}$ by concatenating the outputs of h_1 and h_2 , that is, $h(x) = h_1(x)||h_2(x)$ where $\|$ is concatenation. Suppose h_1 is collision resistant but h_2 is not. Can we say that h is collision resistant? Prove your claim.

Suppose we have a collision-resistant hash function $h_1 : \{0,1\}^* \rightarrow \{0,1\}^n$ and a non-collision-resistant hash function $h_2 : \{0,1\}^* \rightarrow \{0,1\}^n$ where the output of both f is fixed of n bits. Say we construct another hash function, $h(x) = h_1(x)||h_2(x)$. Then we still know it is collision-resistant.

Proof By Contradiction. Assume that $h(x) = h_1(x)||h_2(x)$ is not collision-resistant for any collision-resistant h_1 and non-collision-resistant h_2 . Then we must show that is computationally feasible to find some $x_1, x_2 \in \{0,1\}^*$ s.t. $x_1 \neq x_2$ and $h(x_1) = h_1(x_1)||h_2(x_1) = h_1(x_2)||h_2(x_2) = h(x_2)$. To start, we know that h_2 is not collision-resistant. Then it is computationally feasible to find some $x_1, x_2 \in \{0,1\}^*$ s.t. $x_1 \neq x_2$ and $h_2(x_1) = h_2(x_2)$. Then we can say it is computationally feasible to find some $x_1, x_2 \in \{0,1\}^*$ s.t. $x_1 \neq x_2$ and $h_1(x_1)||h_2(x_1) = h_1(x_2)||h_2(x_2)$. However when observe that for the same $x_1 \neq x_2$ and the fact that h_2 is collision-resistant reasoning it is computationally infeasible to find some $x_1, x_2 \in \{0,1\}^*$ s.t. $x_1 \neq x_2$ and $h_1(x_1) = h_1(x_2)$, we can say that even if $h_2(x_1) = h_2(x_2)$, $h_1(x_1)||h_2(x_1) \neq h_1(x_2)||h_2(x_2)$. This can be seen as we can cancel the concatenation of $h_2(x_1)$ and $h_2(x_2)$ on both sides of the equality to get the equality $h_1(x_1) = h_1(x_2)$ which is computationally infeasible to derive such $x_1 \neq x_2$ for. As a result, we've reached a contradictory statement as h_1 is known to be collision-resistant. Hence proven.
